

Use an Experienced Team and a Process That's Most Effective Against the Spread of COVID-19

Complete disinfection of your facility or workspace requires steps to ensure your environment is clean – and virus-free.

Our **professional-grade disinfection solution** meets the **CDC/EPA efficacy requirement against the Coronavirus (COVID-19)** and is effective for corporate office spaces, transportation centers, retail environments, and hospital/medical facilities.

Traditionally, disinfecting occurs by wiping surfaces with an infused cloth that is only mildly effective in getting complete coverage of an area, and this runs the risk of cross contamination. Fogging in and by itself is effective in killing most viruses, especially COVID-19.

Take no shortcuts and rely on a professional, qualified team. RD Weis leads the way with 10-plus years of experience in disinfection. We have the **Chemistry, Equipment & Protective Gear** to handle the demand. Supplies of all types face availability challenges. However, we currently have adequate supplies of qualified disinfecting solutions and labor resources to meet customer disinfection needs.

We are here to help you. Please contact us to learn more or schedule professional disinfection treatments for your facilities.

We have the products, we know them and we know how to use them.

Benefits of our Process

- EPA Registered products that meet the CDC efficacy guidelines against COVID-19
- 10-plus years of experience with facility disinfection
- Peace of mind and assurance that when you return to work, your workspace is clean, safe and virus-free

RD Weis Disinfection Process – Things to Know

What is the most effective way to disinfect: wiping or fogging?

Cleaning is required before disinfecting in order to remove dirt, debris and dust because inorganic and organic materials that remain on surfaces may interfere with the effectiveness of disinfection. But simply wiping down your space is not enough to rid your environment of COVID-19. A professional atomizer fog application is necessary to reach every surface area to kill 99.999% of bacteria.

What products do we use?

We use EPA-registered products that kill all viruses on contact

What is the process?

- Surfaces are pre-cleaned and then disinfectant is applied
- The spray needs to sit for ten minutes to kill the virus
- Spraying gets better coverage than wiping. It puts out more product in a larger area
- If a surface is still wet, we will wipe it

How long does it take?

This depends on the size of the space, but the average production rate for a technician equipped with one fogging machine is 4,000 square feet per man hour

Is it safe?

- Our products are safe around people, pets, plants and food
- Products are safe for all environments, including corporate offices, hospitality, restaurants, retail and schools

How soon can you return to work?

Almost immediately

In which type of environment is this effective?

Schools, healthcare facilities, corporate offices, airports and transportation centers, restaurants, retail establishments, gyms, museums, conference centers, utility companies, EMS facilities, etc.

The Time is Now
